GS-4 LOCOMOTIVE & TENDER INSTRUCTIONS

Thank you for purchasing a Williams by Bachmann® locomotive. This locomotive has been manufactured to provide years of use and enjoyment. Please follow the simple instructions below.

This locomotive has been greased and tested before leaving the factory. Before operating, please lightly lubricate the points shown in the diagram below. Do not over-lubricate and take extra care to avoid getting lubricants on the wheel surfaces or traction tires.

Figure 1

1. For the axles and coupler pivot points **Marked A**, we recommend that you lubricate with a small amount of light oil such as Bachmann E-Z Lube® #99984 Light Gear Oil. You may also want to put a very small amount on the rotating points of the side rods. **Do not over-lubricate.**
2. For areas that require electrical flow, such as roller pick-ups **Marked B**, please use Bachmann E-Z Lube® #99981 Conductive Contact Lube. **Never use any Teflon® based oil on these areas because this type oil has insulating properties.**

OPERATION

After unpacking the locomotive, make sure that the uncoupling plunger is in the correct position with the pin inserted in the knuckle (see figure 1). Failure to do so will allow the uncoupling plunger to contact the center rail and a direct short will occur when power is applied to the track. We recommend using an AC hobby transformer with maximum voltage output of 18 VAC and a wattage rating of **at least 90 watts**.

Throttle Control

The throttle control will allow you to operate your train at a wide range of speeds. Slowly turn the control knob until you are familiar with the response of the locomotive that you are operating. Please note that our sound systems require 6 volts or greater to operate correctly.

Whistle Operation

To operate the horn of your locomotive, simply depress the horn /whistle button on your transformer. Our True Blast™ Whistle will play a 6 second sequence one time.

Bell Operation

To operate the bell on your locomotive, press and hold the bell button for one second. To stop the bell, press and hold the button for one second.

Direction Control

Williams reverse units sequence FORWARD, NEUTRAL, REVERSE, NEUTRAL, and again FORWARD. To sequence the reverse board, simply depress and hold the direction button, release the button 1 second after the train has come to a complete stop. **PLEASE NOTE:** If you do not wait for your train to come to a complete stop the reverse unit may not always sequence properly. After approximately 7 seconds without power, the reverse board will reset to FORWARD.

Smoke Unit

This locomotive is equipped with an operating smoke unit. If you wish to use this feature add 10-15 drops of the supplied smoke fluid into the smoke stack of the locomotive. Use only Williams by Bachmann® or Bachmann® Fluid. Other brands may be too thick and clog the unit.

Uncoupling

This locomotive is equipped with operating knuckle couplers on the rear of the tender. To uncouple, position the uncoupling plunger over the center of electro-magnetic track uncoupling section and activate the magnet.

PERIODIC MAINTENANCE

Disassembly Instructions

For periodic maintenance, you will have to remove the body shell to gain access to some of the parts that require servicing. The body shell is attached with three screws on the bottom of the locomotive chassis. One screw is in the front screw and there are two additional screws in the rear. See Figure 1 for the exact location of the screws. Next re-attach the body shell using care not to over-tighten the screws.

Lubrication

We recommend that you lubricate as directed on page 1 every 10 hours of operation. In addition, you also should check the motor gearbox every 25 hours. To gain access to the gearbox, remove body shell as instructed above. Next, unscrew the screws that cover the grease box (two small Phillips-head screws in front of the motor assembly). Inspect the gears and apply any necessary lubrication. We recommend Bachmann E-Z Lube® #99982 Grease, or equivalent. Replace the gear box cover when complete.

Traction Tire Replacement

Our traction tires are very durable and should not need replacing very frequently. They should last hundreds of hours under normal conditions. If they wear out prematurely, check to make sure your track joints are tight. Gaps in your track can cause damage to the tires. To replace the traction tires, you will need to remove the side rods. There are three Hex screws and one Phillips-head screw on each side. Note the positions of the rods and any spacers. Remove old tire if present, clean wheel groove with any degreasing agent **making sure to follow the safety and handling instructions on the degreasing agent's bottle**. Wipe dry with paper towel or clean rag. Stretch the new traction tire over the wheel making sure that it does not twist and seats smoothly in the wheel groove. Re-attach the side rods. Test to make sure the rods move freely before applying power to the locomotive. Check at least one complete rotation of the wheels before applying any power. You can manually spin the flywheel on the end of the motor to make the wheels spin,.

Light Bulb Replacement

This locomotive uses an 8 volt bayonet bulb
